

This was a wireframe proposed to redesign the main Build (event) view in Kashti.

The order of jobs and logs has gotten too busy, the page too long. The Build is composed of child Jobs, which often have their own logs, but in addition the Build itself has worker logs itself. These originally sat at the top of the page - but their length pushed the jobs down and out of view.

An update PR later moved the Build worker log to the bottom of the page, but now the order of processes is confusing and not optimal.

<- This wireframe was a suggestion to make this section into a column, tabbed layout. Event or Job info sits in a tree to the left (much like the orientation of a code editor UI). Selecting an item refreshes the main black panel to the right with the logs for that item.

On inital load, the view should default to
